

Bold and blue LED mood lighting

for French airline Joon

Aimed at the millennial traveller, Air France subsidiary Joon needed a bold, stylish cabin interior to match their new boutique offering.

Cabin interior designers at Joon recognised how dramatically mood lighting can alter the aesthetics and atmosphere of an aircraft cabin, and wanted to invest in creating a comfortable, relaxed environment for passengers.

We worked with Joon to design a collection of lighting scenes that was at once clean, contemporary, relaxing and rejuvenating. We included a punchy electric blue lighting scene to reinforce the youthful, fun side of the brand, bright and beautiful white lighting for boarding and softer, peachy scenes for easing passengers into wakefulness on longer flights.

Cobalt Spectrum's easy, fast installation process and efficient design also appealed to engineers and designers at Joon. Our lighting units are incredibly simple to install, and **require no changes to the aircraft wiring, procedures or the Cabin Attendants panel**. In addition, no special tools are needed to install *Cobalt Spectrum* – the team at Joon were able to simply remove the old lighting units, fit their new system and fly away!

Our class-leading mood lighting not only offers a choice of **over 16 million colours using the brightest and best LEDs**, but is also the most lightweight solution with the **lowest power consumption and through-life costs of all OEM and retrofit solutions**.

Joon's natural choice was *Cobalt Spectrum*. Joon selected the Cobalt Aerospace product for its **unique features and class-leading performance**, as well as for its simplicity.

We're certain all will agree that the cabin effect is amazing!
